Stress Protecta

PLANT PROTECTION

Prevents
water loss
by up to
50%

Protects your plants from heat,
water loss, drying winds, sunburn,
droughts, frost and transplant shock

NET CONTENTS:
750 mL

DAVID GRAYS

Ready to use Stress Protecta

Stress Protecta helps to protect plants from damaging environmental conditions including heat and water loss, drying winds and sunburn, droughts, light frosts and transplant shock with a protective, clear, polymer film over leaves that can last for up to 60 days.

The product improves plant survival and recovery from stress conditions and reduces water loss from plants by up to 50%. Ideal for protecting newly transplanted seedlings, flowers and shrubs.

Stress Protecta is biodegradable and remains soft and pliable, stretching up to 100% with plant growth. Stress Protecta does not wash off once the spray has dried.

HOW TO USE: SHAKE BOTTLE WELL BEFORE USE. Spray leaves and stems until run-off, ensuring thorough coverage of both upper and lower leaf surfaces. For best results spray in the cool of the day when conditions are calm. Certain plants such as ferns and bromeliads are sensitive to sprays. Test on a small sample first if in doubt.

SITUATION		HOW TO APPLY
Sun and wind exposure	Drought	Water plant well and spray before stress conditions begin.
	Seedlings and cuttings	Respray new growth as required and when conditions are severe.
Planting	Trees and shrubs	Spray immediately following transplanting and repeat at 7 day intervals until established.
	Light frost protection	Water plant well and spray product several hours before transplanting.
		Spray in late Autumn before frost begin and repeat at 30 day intervals until danger of frost has passed.

EDIBLE PLANTS SHOULD BE WASHED PRIOR TO EATING
